1.0	2020-07-30	Noise Impact Study, 752 Queen Street East, St. Marys	TMC

Executive Summary

Cambium Inc. was retained by Yao Zhang in response to a request by the Town of St. Marys, to complete a noise impact study for a proposed commercial development consisting of an expansion of the existing convenience store and gas station, with addition of a car wash, and a commercial retail building. The site is located at 752 Queen Street East, in the Town of St, Marys, Ontario. The purpose of this study is to provide an assessment of the potential noise impacts from the proposed operations of the site on the nearby residential properties.

As a reasonable worst case scenario, the primary operations of the site potentially include the following noise sources; the drive through menu order box, idling vehicles at the drive through and at the car wash, the car wash, a kitchen ventilation fan, and rooftop heating ventilation, and air conditioning units. The gas bar itself, parking, as well as occasional delivery of goods to the convenience store/fast food restaurant are not considered a noise source as per the Ministry of Environment, Conservation, and Parks publication NPC-300; Environmental Noise Guideline Stationary and Transportation Sources – Approval and Planning. Vehicle parking is provided on site. The facility is not expected to be a source of vibration.

The proposed aspects of the facility are not yet constructed, so source sound power data was obtained from manufacturing specifications or from Cambium's noise source library. The source sound power levels were used as input to a predictive model to quantify the potential environmental sound emissions associated with the Facility. Criteria were established in accordance with the sound level limits in NPC-300 with consideration for the Noise By-Law of the Town of St. Marys.

Cambium concludes the site as presented, under the conditions and assumptions of this report, can operate in compliance with provincial noise guidelines and local noise control by-laws and is therefore a feasible land use from a noise perspective.

1.0 Introduction

Cambium Inc. (Cambium) was retained by Yao Zhang, in response to a request by the Town of St. Marys, to complete a noise impact study for the proposed development (the Site) consisting of an expansion of the existing convenience store and gas station, with the addition of a car wash, and a commercial retail building. The Site is located at 752 Queen Street East, in the Town of St. Marys, Ontario. The purpose of this study is to provide an assessment of the potential noise impacts from the proposed operations of the site on the nearby residential properties.

We conducted an assessment of the proposed development's noise impacts onto the surroundings. As a reasonable worst case scenario, the primary operations of the site potentially include the following noise sources; the drive through menu order box, idling vehicles at the drive through and at the car wash, car wash doors, a kitchen ventilation fan, and rooftop heating ventilation, and air conditioning (HVAC) units. The gas bar itself, parking areas, and occasional deliveries to convenience and fast food operations, are not considered to be noise sources as per the Ontario Ministry of Environment, Conservation, and Parks (the Ministry) document *NPC-300 – Environmental Noise Guideline – Stationary and Transportation Sources – Approval and Planning (NPC-300)* (MOECC, 2017). The facility is not expected to be a source of vibration.

Noise impact criteria were established in accordance with the sound level limits in NPC-300 and with consideration of the Town of St. Marys Noise By-Law (The Corporation of the Town of St. Marys, 2007).

Locations have been identified as being representative of the most sensitive points of reception in the vicinity of the Site. The Site and receptors, are located in a suburban area with commercial and residential zoning, and are in close proximity to Queen Street East, which is a relatively significant arterial road. There are nearby industrial facilities also located to the east of the site. The Site is therefore best defined as class 2 (semi-urban). The receptors close to Queen Street East are best defined as class 2, while the receptors further from the roadway

are defined as class 3. This determination was made following the procedures of NPC-300 with the support of local land use, traffic data, and Cambium's site measurements.

2.0 Description of Proposed Development

The proposed development is a commercial expansion to an existing facility. The development will consist of an expansion of the existing convenience store and gas station, with addition of a fast food restaurant and drive through, car wash, a commercial retail building. The Site is zoned as commercial, with nearby commercial, industrial, open space, and residential zoning.

A site location plan showing the Site and nearby roadways is provided on Figure 1.

Cambium will assess noise impacts in all three of the time frames outlined in NPC-300 including daytime (7 am to 7 pm), evening (7 pm to 11 pm), and nighttime (11 pm to 7 am), however, some noise sources are only active at certain times. The noise sources associated with the operation of the Site are described in section 3.1.

The North American Industrial Classification System (NAICS) code that best applies to this Site is 447110 (Gasoline stations with convenience stores). Other applicable codes may include; 811192 (Car washes), 722512 (Limited-service eating places).

3.0 Impact of the Proposed Development onto the Environment

The development is in the preliminary design stages, therefore this assessment is intended to confirm the site is capable of complying with NPC-300 and local by-laws at the nearby sensitive receptors. The additional road traffic as a result of this proposed development will not be significant in comparison to existing traffic levels in the area.

The Town of St. Marys Noise By-Law may be applicable to certain activities at the site. The specifics of the by-laws is detailed in section 3.2.2.

3.1 Noise Source Summary

The proposed aspects of the facility are not yet constructed, therefore direct measurements of the potential noise sources were not completed. Based on Cambium's experience assessing similar sites, the majority of the potential noise produced by this type of facility is produced by the drive through menu order box, the idling vehicles at the drive through and at the car wash, car wash doors, the kitchen ventilation fan, and the rooftop HVAC units. The gas bar itself is not considered a noise source as per NPC-300. Also, as per NPC-300 it has been assumed that general parking lot vehicle activity would not be considered as significant noise sources. This includes the occasional delivery and removal of goods and waste from convenience stores and fast food partner.

All significant sources are summarized in Table 2 and detailed below. The locations of the all the significant noise sources can be found on Figure 2.

- AH01 – A stationary point source representing the potential rooftop HVAC unit located on the existing Site buildings. The unit currently in use at the existing gas station with convenience store (AH01) is a Lennox, model LGH092. Manufacturer's sound specifications for this unit were utilized, the final selected units should compare their sound power levels to this report to confirm compliance. AH01 is currently installed such that roof features of the building provide noise screening in certain directions.
- AH02, AH03 – Stationary sources representing the potential rooftop HVAC units on the proposed retail building and the proposed fast food operation. Representative

manufacturer's sound specifications for these units were utilized, the final selected units should compare their sound power levels to this report to confirm compliance.

- EF01 – One stationary point source representing a potential rooftop exhaust servicing a kitchen area. A generic 2500 CFM fan was used. Manufacturer's sound specifications for a representative fan were utilized, the final selected unit should compare its sound power level to this report to confirm compliance.
- WD01_O – One stationary emitting façade sources representing the open exit doors of the self-serve automatic car wash. A representative sound power level measured by Cambium in a comparable situation was applied. The open entrance door of the car wash is assumed to be insignificant because the equipment will not be active at this point of the cycle.
- WD01_C, WD02_C – Two stationary emitting façade sources representing the closed doors of the self-serve automatic car wash. A representative sound power level reduction measured by Cambium in a comparable situation was applied.
- VC01, VC02 – These stationary sources represent the potential noise emissions from the proposed vehicle cleaning vacuum stations. A representative sound power level measured by Cambium in a comparable situation was applied.
- VH01 – VH21 – 21 stationary point sources representing potential idling cars at the car wash and/or drive through lineup area. A generic idling car sound power was used with sound specifications from US Department of Transportation.
- MB01, MB02 – Two stationary point sources representing potential drive through menu order boxes located at the drive through lineup area. A generic menu board or speaker post was used. Sound levels are based on Cambium's experience and general requirements of menu boards.

The following noise sources were considered insignificant:

- General ventilation of the buildings where fans are located inside the building envelope such as for washroom vents are considered insignificant.

3.2 Assessment Criteria

The Site is located in a suburban area with commercial and residential zoning, and is in close proximity to Queen Street East, which is a relatively significant arterial road. There are multiple nearby industrial facilities directly to the east of the Site on Industrial Road most of which included observed stationary noise sources and trucking noise sources. The Hydro One Networks Inc. St. Marys Transformer Station is located approximately 250 metres to the west of the Site. The Site is therefore best defined as class 2 (semi-urban). The receptors close to Queen Street East are best defined as class 2 as further supported in section 3.2.1, while the receptors further from the roadway can be defined as class 3 as traffic noise does not support Class 2 levels. The site and all receptors have been characterized to conform to NPC-300.

The Ministry exclusionary sound level limits for class 2 and 3 areas are described below.

Embedded Table 1 Time Period Ministry Exclusionary Sound Level Limit (dBA)

		Sound Level Limit – L_{eq} (dBA)		
		Day (07:00 – 19:00)	Evening (19:00-23:00)	Night (23:00 – 07:00)
Class 2 Plane of Window Noise Sensitive Spaces	Steady L_{eq}	50	50	45
Class 2 Outdoor Points of Reception	Steady L_{eq}	50	45	-
Class 3 Plane of Window Noise Sensitive Spaces	Steady L_{eq}	45	40	40
Class 3 Outdoor Points of Reception	Steady L_{eq}	45	40	-

The sound level limit as received at a POR for stationary sources in a class 2 and/or 3 area is the higher of either the Ministry exclusionary sound level limit (as described above), or the quietest one hour equivalent background sound level (L_{eq}) for each of the time periods described in the table above.

3.2.1 Ambient Traffic Noise

During the site visit, various short term on-site background noise measurements were taken at the Site which indicated that background noise due to road traffic was likely to be significant. Of the on-site background measurements recorded, the lowest background noise level

measured was a 5 minute Leq of 53 dBA. This measurement location was approximately 15 metres north of POR06_A.

Traffic noise assessment was conducted using predictive calculations of road noise developed by the Ministry: *Ontario Road Noise Analysis Method for Environment and Transportation* (ORNAMENT) (MOE, 1999).

The 2018 traffic data used for the road noise assessment was provided by the Town of St. Marys. Percentages of medium (7%) and heavy (5%) trucks were estimated with guidance from the City of Ottawa, Environmental Noise Control Guidelines.

Traffic data and ORNAMENT calculations are provided in Appendix C. ORNAMENT does not accept traffic levels below 40 vehicles per hour therefore only daytime and evening traffic impacts area assumed to have significant contributions.

Embedded Table 2 Traffic Noise Impacts

Source	Minimum hourly traffic ¹	Traffic Breakdown, (Day/Night) ²			Receptor	Impact due to background traffic (dBA)
		Cars	Med. Trucks	Heavy Trucks		Day
Queen Street East, Day	298	262	21	15	130 m from centerline, Front	46.66
Queen Street East, Evening	103	91	7	5		41.91
Queen Street East, Night	22	19	2	1		-

1 – From 2018 traffic data provided by the Town of St. Marys

2 - Medium (7%) and heavy (5%) truck percentage taken from City of Ottawa, Environmental Noise Control Guidelines

Therefore, the current traffic noise impacts support a noise class designation of the Site as Class 2 per NPC-300. Receptors within 130 meters of Queen Street East (POR05 and POR06) are shown to have traffic noise impacts above the Ministry exclusionary sound level limit for class 3, and therefore can be designated as class 2 especially when consideration is made for the nearby transformer station and existing commercial and industrial operations to the east of the receptors.

The specific receptors and applicable sound level limit are summarized in Table 2.

3.2.2 Municipal By-Laws

The Town of St. Marys Noise By-Law may be applicable to certain activities at the site, and defines noise as: *unwanted sound*. The by-law makes the following general prohibitions in section 2:

2. *No person shall, cause or permit noise or vibration which is likely to disturb the quiet, peace, rest, enjoyment, comfort or convenience of the inhabitants of the municipality.*

While the term “likely to disturb” can be subjective, it is assumed that compliance with the NPC-300 exclusionary sound level limits would also achieve compliance with the by-law definition. Note that NPC-300 limits are intended to ensure that there is no “adverse effect” as defined in the Environmental Protection Act.

The specific prohibition of section 3 states that:

3. *Without limiting section 2, no person shall emit or cause or permit the emission of a sound resulting from an act listed in Schedule 1, and which is clearly audible at a point of reception at anywhere within the municipality, at any time.*

Where Schedule 1 lists various types of noise sources such as: racing motorized vehicles, squealing tires, operating unmaintained engines, excessive engine idling, operation of a stereo in motor vehicle such that it can easily be heard outside the vehicle.

In section 4, the by-law also make a prohibition by time and place with reference to a schedule 2. Where schedule 2 lists various types of noise sources and prohibited times, such as: the operation of any electronic device intended for the amplification of sound, the operation of motorized conveyance other than on a place intended for its operation, yelling, shouting, barking. This section of the bylaw could be considered to apply to the drive through menu order box and would indicate it should not be operated from 23:00 one day to 07:00 the next day (09:00 on Sundays). However as discussed above, Cambium interprets that compliance with NPC-300 would indicate the noise is less likely to disturb.

Cambium must note that compliance with NPC-300 does not mean that the Site will not be audible at the point of reception, it means that the sound levels should be low enough to not cause adverse effect.

In section 5 of the by-law, it is stated that *it shall be lawful to emit or cause or permit the emission of sound or vibration in connection with emergency measures*. Other activities are exempted from the By-Law if the persons receive a grant of exemption, or if the activity is defined in schedule 3 of the by-law, such as: parades, fireworks, and events authorized by the municipality, preventative maintenance undertaken by the municipality, essential snow removal, garbage collection, church chimes.

3.3 Point of Reception Summary

Cambium staff visited the Site on June 6, 2020. Seven nearby dwellings were identified as being representative of the most sensitive receptors in the vicinity of the Site, labeled as POR01 through POR07 depicted on Figure 1. Ministry noise guidelines state a “Point of Reception” (POR) is a sensitive noise receptor including residential buildings, schools, places of worship, and hospitals (an office or commercial building is not considered a Point of Reception). For assessment purposes we selected the points with the predictable worst case noise impacts as follows:

- POR01_A represents a class 2 plane of window receptor, modeled at 4.5 metres, for a two storey residential building located on Queen Street East, northeast of the Site;
 - POR01_B is an outdoor living area POR at the same residence, located at the property line in the direction of the Site;
- POR02_A represents a class 2 plane of window receptor, modeled at 4.5 metres, for a two storey residential and commercial building located at 940 Queens Street East, east of the Site;
 - POR02_B is an outdoor living area POR at the same building, located 30 metres from the residence in the direction of the Site;

- POR03_A represents a class 3 plane of window receptor, modeled at 4.5 metres, for a two storey residential building located on Elgin Crescent, southwest of the Site;
 - POR03_B is an outdoor living area POR at the same private residence, located 30 metres from the residence in the direction of the Site;
- POR04_A represents a class 3 plane of window receptor, modeled at 4.5 metres, for a two storey residential building located on Elgin Crescent, southwest of the Site;
 - POR04_B is an outdoor living area POR at the same private residence, located 30 metres from the residence in the direction of the Site;
- POR05_A represents a class 2 plane of window receptor, modeled at 7.5 metres, for a three storey residential building located on Birch Drive, as part of the housing cooperative at 728 Queen Street East, west of the Site;
 - POR05_B is an outdoor living area POR at the same residence, located 30 metres from the residence in the direction of the Site;
- POR06_A represents a class 2 plane of window receptor, modeled at 7.5 metres, for a three storey residential building located on Birch Drive, as part of the housing cooperative at 728 Queen Street East, west of the Site;
 - POR06_B is an outdoor living area POR at the same residence, located 30 metres from the residence in the direction of the Site;
- POR07_A represents a class 3 plane of window receptor, modeled at 4.5 metres, for a two storey residential building located on Widder Street East, northwest of the Site;
 - POR07_B is an outdoor living area POR at the same residence, located 30 metres from the residence in the direction of the Site;

The surrounding area was assessed for vacant lots. No nearby vacant lots were identified as being more sensitive than the existing homes listed above.

3.4 Impact Assessment

Cambium's acoustic analysis at the PORs incorporates the noise emission points as described in Section 3.1. We based sound power levels for equipment on measurements on site, measurements at similar sites for generally assumed equipment, engineering calculations, and/or manufacturer's specifications.

We detail the corresponding sound power level calculations from each noise producing unit in Appendix A. The assumed, most conservative, sound power levels in accordance with the Ministry's requirement for "worst case" noise source sound power levels are summarized in Table 1.

We summarize the predicted sound levels at the identified PORs due to each noise source in Table 2. The table also includes the distance from each source to the identified POR. Our impact assessment results are provided in Appendix B and the expected Site noise impacts at the identified PORs are summarized in Table 3.

3.4.1.1 Sound Power Level

Sound power levels were based on calculations from measurements at the site and; at similar sites, engineering calculations, and manufacturer's specifications; the supporting information can be found in Appendix A. We completed all measurements following Ministry guidance for measurements including satisfactory weather conditions and pre-post calibrations.

3.4.1.2 Tonality Assessment

Generally, we do not expect the sources to be tonal in nature, however, a tonality is indicated in the manufactures specifications used for sources AH02 and AH03. Therefore the appropriate tonal penalties are included in the applied sound power levels.

3.4.1.3 Variable Operations of Noise Sources

For the purposes of NPC-300 assessment the following variability assumptions have been made.

Some noise sources are only active during defined times of the day, these time frames are treated as a noise control by this report since they must be complied with to achieve the required noise levels:

- WD01_O, WD01_C, WD02_C, (VH01 – VH05), VC01, VC02 – Noise sources associated with the car wash and vacuums may occur during daytime hours only (07:00-19:00).

The following time restrictions have been selected by Cambium as realistic worst case scenarios. It is anticipated that these time restrictions will be met by the regular operations of the facility without implementing these items as formal controls:

- VH06 – VH21 – Noise sources associated with the idling cars in the line at the fast food partner operation. Cambium has assumed up to 12 vehicles could be idling in the evening and night (19:00-07:00). It was assumed up to 16 vehicles could be idling during daytime hours (07:00-19:00).
- AH01, AH02, AH03 - Point sources representing steady state HVAC noise are active only 75% of the time during daytime hours (07:00 – 19:00) and 50% of the time during evening and nighttime hours, when it is cooler. This represents the normal operating cycle of this type of equipment.
- WD01_O – The Noise source representing car wash open doors is active only 16% of the time (10 minutes of any given hour). This is a reasonable assumption since this door would only be open and emitting noise, when the cars are leaving the carwash.
- WD01_C, WD02_C –The closed doors are an active noise source for up to an additional 66% of the time (<=40 minutes of any given hour). Therefore, the car wash is not emitting significant noise for approximately 33% of the time (20 minutes of any given hour), this time of low emissions is consistent with the time it takes additional users to move into the carwash and wait for the carwash to begin operations. This represents a worst case scenario of the cycle during normal operation.

- VC01, VC02 - Noise sources representing vacuums were modelled as being active only 25% of the time (15 minutes of any given hour) which represents the normal operating cycle of this type of equipment.

These operating cycles were confirmed with the operator to be reasonable assumptions based on the expected maximum traffic flow through these processes.

3.4.1.4 Noise Control Measures

- The existing HVAC unit (AH01) located on the existing building is installed on the roof in such a way that roof features screen certain directions from the noise source. This roof feature screen was incorporated into the model as a barrier (BR01). This arrangement must remain in place.
- Cambium has been informed the proposed retail building, and proposed fast food restaurant designs both include parapet walls at 1 metre above the roof deck. These parapets must be installed as noise controls. Cambium modelled the air handling units in the centre of the rooftops with heights above the roof deck of 1 metre. If there is significant modification from this assumption, calculations should be modified during detailed design.

The noise barrier parapet must be constructed to meet a surface density of 20 kilograms per square metre, and be constructed with no cracks or gaps

3.4.2 Nighttime Carwash Scenario

Cambium has been requested to outline what noise controls may be required if in the future the car wash is proposed to operate in the evening and night (19:00-07:00). The following modifications would ensure nighttime compliance with evening/nighttime carwash operations:

- A two metre tall noise barrier, constructed with a surface density of 20 kilograms per square meter, constructed along the fast food partner's drive through line, screening the first six waiting cars from receptors POR03-POR06. This optional barrier is shown in Figure 2.

As an operational assumption, Cambium has assumed if the carwash operated at night that the following realistic reductions in traffic would be expected:

- Up to 3 cars would be waiting in the queue for nighttime car wash operations, versus 5 cars during the daytime hours.

3.5 Noise Impact Calculation Procedure

The noise impact calculations were performed using the Brüel Kjaer *Predictor Type 7810 version 2020* (Predictor) environmental noise prediction and control software. The calculations completed by this software are based on established prediction methods accepted by the Ministry; mainly ISO 9613-2 *Acoustics – Attenuation of Sound during Propagation Outdoors – Part 2: General Method of Calculation* (ISO, 1996). Predictor is an internationally marketed software package that offers calculation algorithms that comply with ISO 9613-2.

The Predictor software tool is a proprietary noise calculation package used to calculate, assess, predict, and display environmental noise. This software utilizes calculation algorithms and 3D visualization of the predicted noise emissions, often referred to as acoustic mapping. The software calculates the resultant noise level and takes into account a range of factors affecting the propagation of sound including:

- Sources with direct line of site to receivers ignore barriers;
- Negative ground attenuation over barriers is not subtracted;
- The Facility layout, which includes the position and elevation of each building, major equipment and other facades in the propagation path;
- The natural topography and vegetation;
- The magnitude of the noise source in terms of octave band sound power;
- The distance between the source and the POR;
- The presence of reflecting surfaces; and,
- The hardness of the ground between the sources and the POR.

3.6 Calculation Assumptions

We have assessed the plane of window receptor at 1.5 metres and at the perimeter of the residence, representing the plane of a first storey exterior room door or window within which, a person may be exposed to sound if open. If the residence is multi-storey, we model the plane of window receptor at 4.5 metres for secondary storey, or 7.5 metres for third storey, etc. We assessed the outdoor receptors at a height of 1.5 metres.

We modelled the site and the surrounding area as acoustically absorptive with a ground factor of 1 which would correspond to soft ground. The proposed site parking areas and other areas that are mostly paved were modelled as hard ground with a ground factor of 0. Forested areas were not considered, and therefore we have conservatively not included any attenuation provided by foliage.

This version of Predictor allows for settings to ignore barrier effects if line of sight is not broken, as well as avoiding overestimating barrier effect due to porous ground in the case of a negative Agr value in Equation 12 of the ISO 9613-2 calculation method. We activated these settings:

- The terrain was modelled with consideration from Ontario Base Map sources; and
- Onsite buildings were considered, and were incorporated into the model as being mostly reflective, no other offsite sources of sound were considered (i.e. traffic, etc.).

Due to the numerous conservative assumptions that have been made, this assessment is likely an over-prediction.

3.7 Acoustic Assessment Summary

We summarize the model predicted sound pressure levels for each noise source in Table 2. The power levels used in this assessment are representative and indicate the allowable sound power levels based on preliminary design information. We present the total noise impact from the development at each receptor in Table 3. The sound pressure level contour plot files and the predicted sound levels at the receptors are provided in Appendix B. As indicated in Table 2 and Table 3, the development noise impact at each established POR is predicted to be less

than the applicable criteria set by the Ministry, provided recommendations of this report are followed.

The above assessment considered a worst case point of reception for indoor and outdoor receptors, and a worst case sound level from operations, thereby indicating conservative estimates for potential noise impact.

4.0 Recommendations

In summary Cambium has made the following recommendations:

- Layout of equipment and building features may affect noise impacts, and therefore the controls required. The site should be laid out generally as shown in this report or calculations may require revision;
 - The HVAC source AH01 on the existing roof, must remain installed as it is.
 - The HVAC sources AH02, AH03 must be screened from the receptors to the by the proposed parapet wall for retail building and fast food building. The Parapet must be constructed to meet 20 kilograms per square metre, and be constructed with no cracks or gaps. Cambium has assumed the HVAC units will be placed in the centre of the building.
 - AH02 and AH03 were modelled with representative sound powers provided in this report, final equipment selection must ensure that the selected units meet this sound power level rating.
- Car wash operations must be limits to daytime hours only (07:00-19:00) unless the additional mitigation measure of a 2 meter tall barrier wall screening the first 6 cars in the restaurant lineup from POR3 to POR6 is construction. If the barrier is constructed it must be at least 20 kilograms per square meter, and be constructed with no cracks or gaps.
- When detailed design is finalized, equipment noise levels should be compared back to this report to confirm equivalent equipment is selected this includes the air handling units, kitchen exhaust, car wash, and vacuum sources;
- The Town of St. Marys Noise By-Law may be applicable to certain activities at the site. Some terms used in the by-law can be subjective, therefore it is assumed that compliance with the specific NPC-300 exclusionary sound level limits would also achieve compliance with the by-law definitions.

- Cambium would recommend that the final design of this proposed operation be reviewed for compliance with this report and/or NPC-300 by a qualified professional.

5.0 Conclusions

Cambium Inc. was retained by Yao Zhang, in response to a request by the Town of St. Marys, to complete a noise impact study for a proposed development located at 752 Queen Street East, in the Town of St. Marys.

The results of this noise impact study, under the defined conditions and assumptions, and based on the information provided to Cambium, indicate that the predicted noise impacts from the proposed Site, at the identified most sensitive points of reception, are less than the applicable limits listed in Ministry noise guideline, NPC-300.

It is Cambium's opinion that the proposed operation is capable of operating in compliance with NPC-300 and therefore is compatible with the surroundings.

Respectfully submitted,

Cambium Inc.

West Caldwell Calibration Laboratories Inc.

Certificate of Calibration

for

HANDHELD ANALYZER

Manufactured by: BRUEL & KJAER
Model No: 2270
Serial No: 2679353
Calibration Recall No: 30681

Submitted By:

Customer: Jade McGann
Company: Cambium Inc.
Address: 52 Hunter Street East
Peterborough, On Cana

K9H 1G5

The subject instrument was calibrated to the indicated specification using standards traceable to the National Institute of Standards and Technology or to accepted values of natural physical constants. This document certifies that the instrument met the following specification upon its return to the submitter.

West Caldwell Calibration Laboratories Procedure No. 2270 BRUE

Upon receipt for Calibration, the instrument was found to be:

Within (X)

tolerance of the indicated specification. See attached Report of Calibration.

The information supplied relates to the calibrated item listed above.

West Caldwell Calibration Laboratories' calibration control system meets the following requirements, ISO 10012-1 MIL STD 45662A, ANSI/NCSL Z540-1, IEC Guide 25, ISO 9001:2015 and ISO 17025

Note: With this Certificate, Report of Calibration is included.

Approved by:

James Zhu

Memo**Re: Drive-Thru Sound Pressure Levels From the Menu Board or Speaker Post**

The sound pressure levels from the menu board or speaker post are as follows:

1. Sound pressure level (SPL) contours (A weighted) were measured on a typical HME SPP2 speaker post. The test condition was for pink noise set to 84 dBA at 1 foot in front of the speaker. All measurements were conducted outside with the speaker post placed 8 feet from a non-absorbing building wall and at an oblique angle to the wall. These measurements should not be construed to guarantee performance with any particular speaker post in any particular environment. They are typical results obtained under the conditions described above.
2. The SPL levels are presented for different distances from the speaker post:

Distance from the Speaker (Feet)	SPL (dBA)
1 foot	84 dBA
2 feet	78 dBA
4 feet	72 dBA
8 feet	66 dBA
16 feet	60 dBA
32 feet	54 dBA

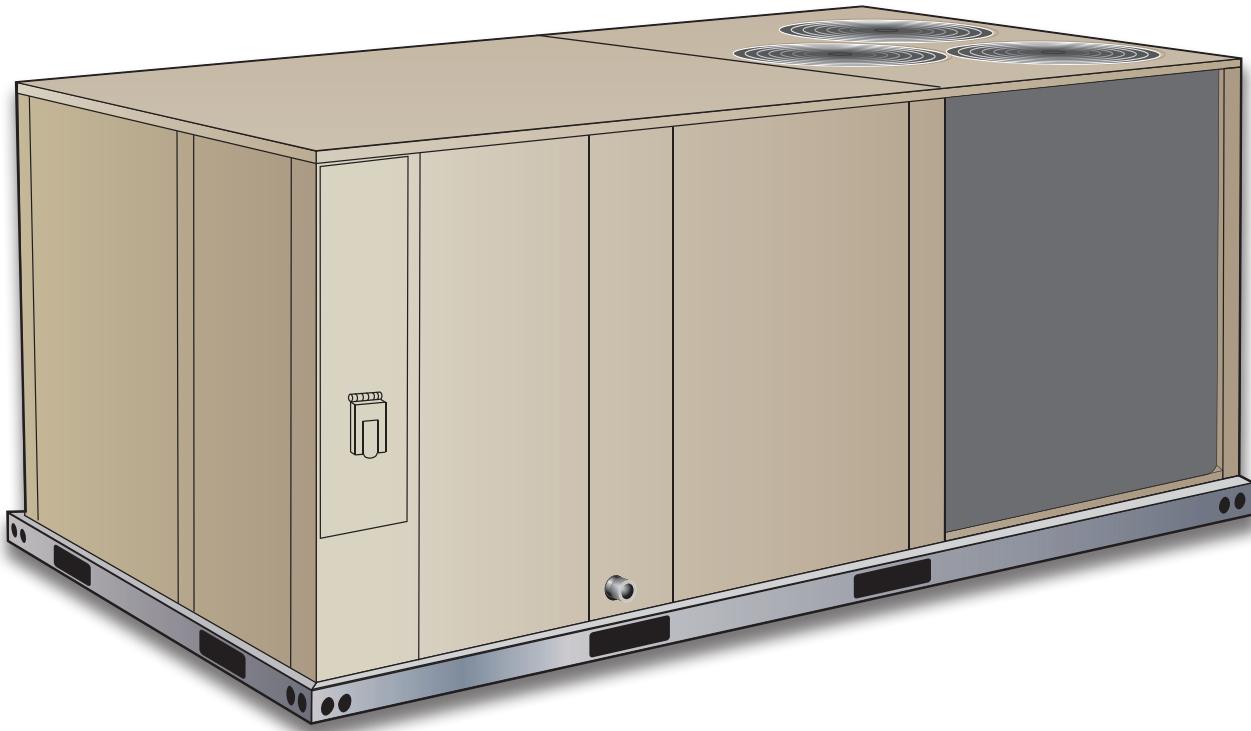

3. The above levels are based on factory recommended operating levels, which are preset for HME components and represent the optimum level for drive-thru operations in the majority of the installations.

Also, HME incorporates automatic volume control (AVC) into many of our Systems. AVC will adjust the outbound volume based on the outdoor, ambient noise level. When ambient noise levels naturally decrease at night, AVC will reduce the outbound volume on the system. See below for example:

Distance from Outside Speaker	Decibel Level of standard system with 45 dB of outside noise <u>without</u> AVC	Decibel level of standard system with 45 dB of outside noise <u>with</u> AVC active
1 foot	84 dBA	60 dBA
2 feet	78 dBA	54 dBA
4 feet	72 dBA	48 dBA
8 feet	66 dBA	42 dBA
16 feet	60 dBA	36 dBA

If there are any further questions regarding this issue please contact HME customer service at 1-800-848-4468.

Thank you for your interest in HME's products.

Outlet	85	80	84	79	75	74	67	59	82	70

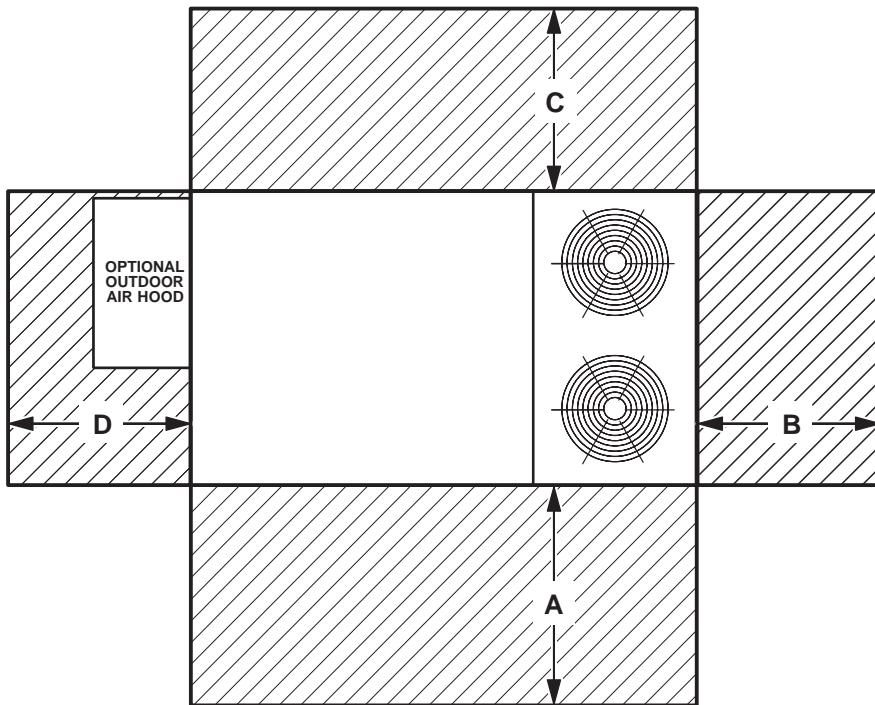

Performance certified is for installation type B: free inlet, ducted outlet. Power rating (BHP/kW) does not include transmission losses. Performance ratings do not include the effects of appurtenances (accessories). The sound power level ratings shown are in decibels, referred to 10(-12) watts calculated per AMCA Standard 301. Values shown are for inlet Lwi, LwiA and outlet Lwo, LwoA sound power levels for installation type B: free inlet, ducted outlet. Outlet ratings include the effects of duct end correction. The A-weighted sound ratings shown have been calculated per AMCA Standard 301. The AMCA International licensed air and/or sound performance data has been modified for installation, appurtenances or accessories, etc. not included in the certified data. The modified performance is not AMCA licensed but is provided to aid in selection and applications of the product.

The dBA levels shown have been calculated for a distance of 5 ft in a hemispherical free field. dBA levels are not licensed by AMCA International.
